Table 10-1 gives a "Support available strength per inch thickness" but does not mention anything about ignoring eccentricity that would cause tension and shear in bolts normal to the faying surface. AISC design examples do not address this additional check for table 10-1, so am I assume it doesn't need to be done.

Design of Beams (Flexural Members) (Part 5 of AISC/LRFD)

The AISC Code defines structural steel as elements that are required to support the design loads of a building and fit within the components of a structural frame. For clarity, the AISC category system is typically only applied to fabricated structural steel as referenced in Section 2.1 of the Code: anchor rods, base plates, beams, bracing, canopy
