Optimization Of Industrial Unit Processes

With this approach, the sides of a multivariable control envelope are the various constraints while inside the envelope the process is continuously moved to maximize efficiency and productivity.Because one must understand a process before one can control it (let alone optimize it), Optimization of Industrial Unit Processes discusses the "personality" and characteristics of each process in term of its time constants, gains, and other unique features.This book provides information for ...

Optimization of Industrial Unit Processes ()

The Practical Optimization of Industrial Processes is closely linked to the subject of BPM. But before we can delve deeper into this issue, it is important to define what exactly we mean by the practical optimization of industrial processes: Read about a Process Optimization example here.

The Practical Optimization of Industrial Processes

The focus of this chapter is on optimisation of water consumption within industrial sector including process industries (i.e., chemical, food, petrochemical, pulp and paper). The chapter first briefly presents the global water consumption, and water use within the process industries.

17. Water optimization in process industries

Process optimization is the discipline of adjusting a process so as to optimize (make the best or most effective use of) some specified set of parameters without violating some constraint. The most common goals are minimizing cost and maximizing throughput and/or efficiency.

Gas splitting is an energy-intensive process that is widely used in the chemical industry. Consequently, the cost effectiveness of this process can be maximized through energy optimization. This study focuses on the energy optimization of the commercial mixed butane gas-splitting technique via process modification. Because the previous process is impeded by the instability of the n-butane ...
