Limit Vibration Values There are some limit vibration values which can be considered as values indicating a worsening machine condition. We can set up the limits according to some experience with certain machines and there are also for example ISO 10816-3 standards for those limit values. Low Frequency Vibrations All mechanical faults which are related to the speed of the machine such as unbalance, misalignment and mechanical looseness are considered as low frequency vibrations.

ISO 10816 establishes the general conditions and procedures for measurement and evaluation of vibrations from the non-rotating parts of machines. Standards provide guidance for machines operating in the 10 to 200 Hz (600 to 12,000 RPM) frequency range. Examples of these types of machines are small, direct-coupled, electric motors and pumps, production motors, medium motors, generators, steam and gas turbines, turbo-compressors, turbo-pumps and fans.
